If Some News Falls in the Forest, and No One Hears It, Is it Still News?

What a Central Banker Thinks of Bitcoin

After September 12th, pretty much everyone read or heard an off-hand remark about bitcoin by the CEO of one of the country's largest banks. It brought bitcoin into the public discussion. That awareness centered largely around whether bitcoin is a fraud or not, since that was the emotive and operative term used. Coupled with the dizzying price appreciation and dizzying price swings, Jamie Dimon no doubt influenced at least one person who might be considering whether to buy – or hold, for that matter.

Four weeks later, on October 13th, upon questioning and before saying he would no longer speak about bitcoin, he averred that people who buy bitcoin are stupid. One can be forgiven, if that is the most available, recognizable and authoritative voice on the matter, for being swayed by its weight.

On September 29th, sandwiched almost precisely between those two widely disseminated and highly abbreviated remarks was a more lengthy and detailed consideration of bitcoin. This was by someone with, arguably, a higher rank in the world of banking and finance, and speaking to a more erudite audience. Christine Lagarde, former Finance and Economy Minister of France, and the present Managing Director of the International Monetary Fund, was addressing a Bank of England conference in London, marking the 20th anniversary of its being granted operational independence over monetary policy. A major section of her speech dealt with bitcoin. Very clearly, this was not news in the U.S. and therefore could not much affect people's decisions about bitcoin. I was able to find mention of it in The Denver Post. That headline was: "IMF Chief tells central bankers: Ignore Bitcoin at your peril". That portion of her speech is appended to this letter, in case it might have its own impact.¹

Central Banking and Fintech—A Brave New World?

By Christine Lagarde, IMF Managing Director
Bank of England conference, London

September 29, 2017

Governor, Distinguished Guests, Ladies and Gentlemen—Good morning!

Thank you, Mark [Carney], for that kind introduction, and thank you to the Bank of England for inviting me to this wonderful event.

Let us start with **virtual currencies**. To be clear, this is not about digital payments in *existing* currencies—through Paypal and other “e-money” providers such as Alipay in China, or M-Pesa in Kenya.

Virtual currencies are in a different category, because they provide their own unit of account and payment systems. These systems allow for peer-to-peer transactions *without* central clearing houses, *without* central banks.

For now, virtual currencies such as Bitcoin pose little or no challenge to the existing order of *fiat* currencies and central banks. Why? Because they are too volatile, too risky, too energy intensive, and because the underlying technologies are not yet scalable. Many are too opaque for regulators; and some have been hacked.

But many of these are *technological* challenges that could be addressed over time. Not so long ago, some experts argued that personal computers would never be adopted, and that tablets would only be used as expensive coffee trays. So we think it may not be wise to dismiss virtual currencies.

Better value for money?

For instance, think of countries with weak institutions and unstable national currencies. Instead of adopting the currency of another country—such as the U.S. dollar—some of these economies might see a growing use of virtual currencies. Call it dollarization 2.0.

IMF experience shows that there is a tipping point beyond which coordination around a new currency is exponential. In the Seychelles, for example, dollarization jumped from **20 percent** in 2006 to **60 percent** in 2008.

And yet, why might citizens hold virtual currencies rather than physical dollars, euros, or sterling? Because it may one day be *easier* and *safer* than obtaining paper bills, especially in remote regions. And because virtual currencies could actually become *more stable*.

For instance, they could be issued one-for-one for dollars, or a stable basket of currencies. Issuance could be fully transparent, governed by a credible, pre-defined rule, an algorithm that can be monitored...or even a “smart rule” that might reflect changing macroeconomic circumstances.

So in many ways, virtual currencies might just give existing currencies and monetary policy a run for their money. The best response by central bankers is to continue running *effective* monetary policy, while being open to fresh ideas and new demands, as economies evolve.

Better payment services?

For example, consider the growing demand for **new payment services** in countries where the shared, decentralized service economy is taking off.

This is an economy rooted in peer-to-peer transactions, in frequent, small-value payments, often across borders.

Four dollars for gardening tips from a lady in New Zealand, three euros for an expert translation of a Japanese poem, and 80 pence for a virtual rendering of historic Fleet Street: these payments *can* be made with credit cards and other forms of e-money. But the charges are relatively high for small-value transactions, especially across borders.

Instead, citizens may one day prefer virtual currencies, since they potentially offer the same cost and convenience as cash—no settlement risks, no clearing delays, no central registration, no intermediary to check accounts and identities. If privately issued virtual currencies remain risky and unstable, citizens may even **call on central banks** to provide digital forms of legal tender.

So, when the new service economy comes knocking on the Bank of England's door, will you welcome it inside? Offer it tea—and *financial* liquidity?

This information should not be used as a general guide to investing or as a source of any specific investment recommendations. This is not an offer to sell or a solicitation to invest. Opinions and estimates offered constitute the judgment of Horizon Kinetics LLC ("Horizon Kinetics") and are subject to change without notice, as are statements of financial market trends, which are based on current market conditions. Under no circumstances does the information contained within represent a recommendation to buy, hold or sell any security, and it should not be assumed that the securities transactions or holdings discussed were or will prove to be profitable.

This material references cryptocurrencies, including bitcoin. Horizon Kinetics' subsidiaries manage products that seek to provide exposure to bitcoin and other cryptocurrencies. The value of bitcoins is determined by the supply of and demand for bitcoins in the global market for the trading of bitcoins, which consists of transactions on electronic bitcoin exchanges ("Bitcoin Exchanges"). Pricing on Bitcoin Exchanges and other venues can be volatile and can adversely affect the value of the bitcoin. Currently, there is relatively small use of bitcoins in the retail and commercial marketplace in comparison to the relatively large use of bitcoins by speculators, thus contributing to price volatility that could adversely affect a portfolio's direct or indirect investments in bitcoin. Bitcoin transactions are irrevocable, and stolen or incorrectly transferred bitcoins may be irretrievable. As a result, any incorrectly executed bitcoin transactions could adversely affect the value of a portfolio's direct or indirect investment in bitcoin. Only investors who can appreciate the risks associated with an investment should invest in cryptocurrencies or

products that offer cryptocurrency exposure. As with all investments, investors should consult with their investment, legal and tax professionals before investing, as you may lose money.
